General remarks on WIEN2k

- WIEN2k consists of many independent F90 programs, which are linked together via C-shell scripts.
- Each „case“ runs in his own directory `./case`
- The „master input“ is called `case.struct`
- Initialize a calculation: `init_lapw`
- Run scf-cycle: `run_lapw (runsp_lapw)`
- You can run WIEN2k using any www-browser and the w2web interface, but also at the command line in an xterm.
- Input/output/scf files have endings as the corresponding programs:
 - *case.output1...lapw1; case.in2...lapw2; case.scf0...lapw0*
- Inputs are generated using STRUCTGEN(w2web) and `init_lapw`

w2web: the web-based GUI of WIEN2k

- Based on **www**
 - *WIEN2k can be managed remotely via w2web*
- Important steps:
 - *start w2web on all your hosts*
 - login to the desired host (ssh)
 - w2web (at first startup you will be asked for username/password, port-number, (master-)hostname. creates ~/.w2web directory)
 - *use your browser and connect to the (master) **host:portnumber***
 - firefox <http://fp98.zserv:10000>
 - *create a new session on the desired host (or select an old one)*

Welcome to **w2web**

the fully web-enabled interface to WIEN2k

Special: as above, plus

no extra conditions

hkl : $h+k=2n$; $l=2n$

Structure generator

- **Specify:**
 - Number of *nonequivalent atoms*
 - *lattice type* (P, F, B, H, CXY, CXZ, CYZ) or *spacegroup symbol*
 - if existing, you must use a **SG-setting** with inversion symmetry:
 - Si: $\pm(1/8, 1/8, 1/8)$, not $(0,0,0)+(1/4, 1/4, 1/4)$!
 - *lattice parameters* a, b, c (in Å or bohr)
 - *name of atoms* (Si) and *fractional coordinates* (position)
 - as numbers (0.123); fractions (1/3); simple expressions ($x-1/2, \dots$)
 - in fcc (bcc) specify just one atom, not the others in (1/2, 1/2, 0; ...)
- **„save structure“**
 - updates automatically Z , $r0$, *equivalent positions*
- **„set RMT and continue“:** (specify proper “reduction” of NN-distances)
 - *non-overlapping „as large as possible“* (saves time), but not larger than 2.5 bohr
 - RMT for *sp* (d) - elements 10-20 % smaller than for *d* (f) elements
 - *largest* spheres not more than 50 % larger than *smallest* sphere
 - Exception: *H* in C-H or O-H bonds: $RMT \sim 0.6$ bohr ($RKMAX \sim 3-4$)
 - Do not change RMT in a „series“ of calculations, RMT *equal* for *same* atoms
- **„save structure – save+cleanup“**

Program structure of WIEN2k

■ init_lapw

- *step-by-step or batch initialization*
- *symmetry detection (F, I, C-centering, inversion)*
- *input generation with recommended defaults*
- *quality (and computing time) depends on **k-mesh** and **R.Kmax** (determines #PW)*

■ run_lapw

- *scf-cycle*
- *optional with SO and/or LDA+U*
- *different convergence criteria (energy, charge, forces)*

■ save_lapw tic_gga_100k_rk7_vol0

- *cp case.struct and clmsum files,*
- *mv case.scf file*
- *rm case.broyd* files*

RKMAX

- The convergence criterion in APW is the product of $R_{MT} \cdot K_{max}$

$$\Psi = \sum_{K_n}^{K_{MAX}} c_{K_n} e^{iK_n r}$$

- http://www.wien2k.at/reg_user/faq/rkmax.html
- medium quality convergence for **smallest** atom:

- basis set scales with RK_{max}^3
- cputime scales with N_{PW}^3

- increasing Rk_{max} by 10 %
→ doubles cputime

Rkmax	Element
3.0	H
4.5	Li
5.0	Be, B, Si
5.5	C, P
6.0	N, S
6.5	O, Cl, Na, K, Rb, Cs, Mg, Ca, Sr, Ba, Al
7.0	F
7.5	Sc-Cr, Ga-Br, Y-Mo
8.0	Mn-Zn, Ru-Cd, In-I, La, Ce, Hf-Re
8.5	Os-At, Pr-Lu, Ac-Lr

START with **SMALL** Rk_{max} (relaxation), **increase/test** later

BZ integration, "FERMI"-methods

- Replace the "integral" of the BZ by a finite summation on a mesh of "k-points"

$$\rho(r) = \sum_n^{E_n < E_F} \int \psi_{k,n}^* \psi_{k,n} d^3k = \sum_{k,n} w_{k,n} \psi_{k,n}^* \psi_{k,n}$$

- weights $w_{k,n}$ depend on k and bandindex n (occupation)

- for full "bands" the weight is given by "symmetry"

- $w(\Gamma)=1, w(x)=2, w(\Delta)=4, w(k)=8$

➡ shifted "Monkhorst-Pack" mesh

- for partially filled bands (metals) one must find the Fermi-energy (integration up to E_F) and determine the weights for each state $E_{k,n}$

- linear tetrahedron method (TETRA, eval=999)
 - linear tetrahedron method + "Bloechl" corrections (TETRA)
 - "broadening methods"
 - gauss-broadening (GAUSS 0.005)
 - temperature broadening (TEMP/TEMPS 0.005)

- broadening useful to damp scf oscillations, but dangerous (magnetic moment)

k-mesh generation

- **x kgen** (generates k-mesh and reduces to irreducible wedge using symmetry)
 - *automatically "adds inversion"*
 - time inversion holds and $E(k) = E(-k)$
 - except in magnetic spin-orbit calculations (`x -so kgen`; uses `case.ksym` file)
 - `x -fbz kgen` (generates „full mesh“ in BZ)
 - *always "shift" the mesh for scf-cycle*
 - gaps often at Γ ! (might not be in your mesh)
 - *small unit cells and metals* require large k-mesh (1000-100000)
 - *large unit cells and insulators* need only 1-10 k-points
 - use at first a fairly **coarse** mesh for scf/relaxations
 - continue **later** with **finer** mesh
 - mesh was good if nothing changes and scf terminates after few (3) iterations
 - use even finer meshes for DOS, spectra, optics,...

Program execution:

- All programs are executed via the „master“ shell-script `x_lapw`
`x lapw2 -up -orb`

- This generates a „def“ file: `lapw2.def`

```
5, 'tin.in2c',      'old',      'formatted'
6, 'tin.output2up', 'unknown', 'formatted'
8, 'tin.clmvalup',  'unknown', 'formatted'
10, './tin.vectorup', 'unknown', 'unformatted'
```

- and executes: `lapw2c lapw2.def`

- All WIEN2k-shell scripts have long and short names:

- `x_lapw; runsp_lapw, runfsm_lapw` → `x; runsp; runfsm`

- All scripts have a „help“ switch „-h“, which explains flags and options (without actually execution)

`x -h` `x lapw1 -h`

scf-cycle

■ run_lapw [options] (for nonmagnetic cases)

■ -ec 0.0001	<i>convergence of total energy (Ry)</i>
■ -cc 0.0001	<i>convergence of charge distance (e)</i>
■ -fc 1.0	<i>convergence of forces (mRy/bohr)</i>
■ -it (-it1,-it2 , -noHinv)	<i>iterative diagonalization (large speedup)</i>
■ -p	<i>parallel calculation (needs .machines file)</i>
■ -so	<i>add spin-orbit (only after „init_so“)</i>
■ <i>Spacegroups without inversion use automatically lapw1c, lapw2c (case.in1c,in2c)</i>	

■ case.scf: master output file, contains history of the scf-cycle

- *most information is stored with some „labels“ (grep :label case.scf)*

■ :ENE	:DIS	:FER	:GAP	:CTO001	:NTO001	:QTL001
■ :FOR002:	2.ATOM		19.470	0.000	0.000	19.470
■ :FGL002:	2.ATOM		13.767	13.767	0.000	total forces
■ :LAT	:VOL	:POSxxx				

Getting help

- ***_lapw -h** „help switch“ of all WIEN2k-scripts
- **help_lapw:**
 - *opens [usersguide.pdf](#); Use `^f keyword` to search for an item („index“)*
- **html-version of the UG:** (`$WIENROOT/SRC_usersguide/usersguide.html`)
- **http://www.wien2k.at/reg_user**
 - *FAQ page with answers to common questions*
 - *Update information: When you think the program has an error, please check newest version*
 - *Textbook section: DFT and the family of LAPW methods by S.Cottenier*
 - *Mailing-list:*
 - **subscribe** to the list (always use the same email)
 - **full text search** of the „digest“ (your questions may have been answered before)
 - **posting questions:** **Provide sufficient information**, locate your problem (case.dayfile, *.error, case.scf, case.outputX).
 - **„My calculation crashed. Please help.“** This will most likely not be answered.

most common problems

- „QTL-B“ value too large - STOP (or :WARN): “ghostbands”
 - identify for which **eigenvalue**, **atom** and ℓ it happens, check E_F (*case.scf2*, *case.output2*)
 - identify the corresponding linearization energies in *case.scf1*
 - change the corresponding linearization energy in *case.in1*
 - compare and check with :EPL and :EPH lines in *case.scf2*
 - default E-parameters are adapted automatically but may need changes for
 - surfaces, molecules (negative E_F) or heavy elements (E_F often larger than 1.0)
 - add a local orbital (or adjust its energy)
 - if QTL-B occurs for an atom with large RMT, reduce RMT
 - this may happen for larger RKMAX („numerical linear dependency“)
- scf-cycle diverges (grep :DIS *case.scf*):
 - check structure (most likely a wrong structure caused divergence);
 - reduce mixing in *case.inm* slightly; `rm *.broyd* case.scf; x dstart`
 - check E-parameters (see above), check :NEC01 (correct number of e^-)

case.in1

set E_f to $E_F - 0.2$ Ry

Atoms in Molecules

- Theory to characterize atoms and chemical bonds from the topology of the electron density, by R.F.Bader
(http://www.chemistry.mcmaster.ca/faculty/bader/aim/aim_0.html)

Electron density of C_2H_4

■ Bonds are characterized by „critical points“, where $\nabla\rho = 0$

- density maximum: (3,-3); 3 negative curvatures λ , (at nucleus or non-NM)
- bond CP: (3,-1): 2 negative, 1 positive λ (saddle point)
 - positive (and large) Laplacian: ionic bond
 - negative Laplacian: covalent bond
- bridge CP: (3,1)
- cage CP: (3,3) (minimum)

(3,-1) BCP

trajectories of constant $\nabla\rho$
originating at CPs in C_2H_4

- “Atoms” are regions within a zero-flux surface $\vec{\nabla}\rho \cdot \vec{n} = 0$

ρ of C_2H_4 with zero-flux lines defining atomic basins

- example of BN/Ni with “difference” to free atoms,
- workfunction shift
- Bader analysis of some inorganic compounds:

	$\rho(\text{e}/\text{\AA}^3)$	$\Delta\rho(\text{e}/\text{\AA}^5)$	Q (e)
Cl ₂	1.12	-6.1	-
I ₂	0.48	-0.9	-
TiC	0.51	1.8	1.7
TiN	0.47	3.9	1.7
TiO	0.43	5.8	1.5
KCl	0.08	1.2	0.6

Cl₂ more covalent
then I₂

more ionic, but less charge?

less ionic then TiC ?

x aim

■ You must have a “good” scf-density (case.clmsum)

- *no core leakage, LMs up to $L=8-10$ in case.in2*

SURF

Properties with WIEN2k - II

■ Total energy and forces

- *optimization of internal coordinates, (MD, BROYDEN)*
- *cell parameter only via E_{tot} (no stress tensor)*
- *elastic constants for cubic, hexagonal, and tetragonal cells*
- *Phonons via supercells*
 - interface to PHONON (K.Parlinski) – bands, DOS, thermodynamics, neutrons
 - interface to PHONOPY (A. Togo)
 - http://www.wien2k.at/reg_user/unsupported

■ Spectroscopy

- *core level shifts*
- *X-ray emission, absorption, electron-energy-loss (with core holes)*
 - core-valence/conduction bands including matrix elements and angular dep.
- *optical properties (dielectric function in RPA approximation, JDOS including momentum matrix elements and Kramers-Kronig)*
- **fermi surface: 2D, 3D (using XcrysDen)**

Fermi surfaces

■ `xcrysden --wien_fermisurface tin.struct`

- choose a good k-mesh (eg. 10000 points)
- plot the FS for all bands which cross E_F and compare to band structure

- *for 2D plots there is also a WIEN2k-tool „fsgen“ (see UG)*
- *SKEAF (www.wien2k.at/reg_users/unsupported): quantum oscillations*

Properties with WIEN2k - II

■ Total energy and forces

- *optimization of internal coordinates, (MD, BROYDEN)*
- *cell parameter only via E_{tot} (no stress tensor)*
- *elastic constants for cubic, hexagonal, and tetragonal cells*
- *Phonons via supercells*
 - interface to PHONON (K.Parlinski) – bands, DOS, thermodynamics, neutrons
 - interface to PHONOPY (A. Togo)
 - http://www.wien2k.at/reg_user/unsupported

■ Spectroscopy

- *core level shifts*
- *X-ray emission, absorption, electron-energy-loss (with core holes)*
 - core-valence/conduction bands including matrix elements and angular dep.
- *optical properties (dielectric function in RPA approximation, JDOS including momentum matrix elements and Kramers-Kronig)*
- **fermi surface: 2D, 3D (using XcrysDen)**

Cohesive energy

$$E_{A_x B_y}^{cohes.} = E^{crystal} - x E_A^{atom} - y E_B^{atom}$$

- $E^{crystal}$: scalar-relativistic valence (or approx. SO)
- E^{atom} : LSTART: fully-relativistic → inconsistent description
 - for heavier elements (2nd row):
supercell with one atom in a ~30 bohr distorted FCC box
(identical RMT, RKmax, 1 k-point, spinpolarized)

Structural optimizations:

- **Lattice parameters, volume, c/a ratio only via total energies:**
 - *x optimize: creates a series of "struct" files + script "optimize.job"*
 - select volume or c/a, ...
 - select number of cases and desired changes in volume (in % of V_0)
 - *edit optimize.job*
 - adapt to your need: change / uncomment various lines, eg.:
 - select different convergence parameters, parallelization, more iterations (-i 40)
 - modify "save_lapw" line (with more specific names)
 - replace "run_lapw" by "runsp_lapw" or add options (-min -fc 1 -orb)
 - *execute optimize.job*
 - *plot (analyse) the results*
- *combinations of volume and c/a are possible: 2Doptimize*
 - "x optimize" always uses **case_initial.struct** (if present)
 - do a "volume" optimization to create case_vol_xx.struct files
 - copy the respective case_vol_xx.struct file to case_initial.struct
 - x optimize with "c/a" for this particular volume and proceed as above.

Symmetry:

■ WIEN „preserves“ symmetry:

■ *c/a optimization of „cubic“ TiC:*

- change c lattice parameter in TiC.struct (tetragonal distortion, #sym.op=0)
- init_lapw
- change c back to cubic
- x optimize ...

■ *„Jahn-Teller“ distortion:*

- when you start with a perfect octahedra, you will never get any distortion
- → start with slightly distorted positions

Supercells (impurities, vacancies, alloys)

$(0,0,0)$	$P \rightarrow 8 \text{ atoms}$	$(0,0,0)$	$(.5,0,0)$	$(.5,.5,0)$	$(.5,.5,.5)$
			$(0,.5,0)$	$(.5,0,.5)$	
			$(0,0,.5)$	$(0,.5,.5)$	
	$B \rightarrow 4 \text{ atoms}$	yes	yes	no	no
	$F \rightarrow 2 \text{ atoms}$	yes	no	no	yes

4x4x4 supercells: P (64), B (32), F (16) atoms

$\sqrt{2} \times \sqrt{2}$ supercells (1 \rightarrow 2 atoms)

Supercells

- **Program „supercell“:**
 - *start with „small“ **struct** file*
 - *specify number of repetitions in x, y, z (only **integers**, e.g. $2 \times 2 \times 1$)*
 - *specify **P**, **B** or **F** lattice*
 - *add „vacuum“ for **surface** slabs (only (001) indexed surfaces)*
 - *shift all atoms in cell*
- **You must break symmetry !!!** (otherwise `sgroup` will restore your original struct file)
 - ***replace** (impurities, vacancies) or*
 - ***displace** (phonons) or*
 - ***label** at least 1 atom (core-holes, specific magnetic order; change “Fe” to “Fe1”; this tells the **symmetry**-programs that Fe1 is NOT a Fe atom!!)*
- **At present „supercell“ works only along unit-cell axes!!!**

Structeditor (by R.Laskowski)

- requires octave (matlab) and xcrysden (visualization)
- allows complex operations on struct-files

```
octave
s=loadstruct("GaN.struct")
# make an orthorhombic supercell and visualize it
a=[1 0 0; 1 1 0; 0 0 2]
sout=makesupercell (s,a);
showstruct(sout);
# save it as test.struct
savestruct (sout,"test.struct");
# get help on all commands
helpstruct
```

Surfaces

- 2D-slabs with finite number of layers with „vacuum“ in 3rd dimension

bcc (001) 7 layers:

(0 0 6z)
(.5 .5 5z)
(0 0 4z)
(.5 .5 3z)
(0 0 2z)
(.5 .5 z)
(0 0 0)

shift to
→
inversion

(.5 .5 +/-3z)
(0 0 +/-2z)
(.5 .5 +/-z)
(0 0 0)

with lattice parameters:

$a, a, c = (3a + 15 - 20 \text{ bohr vacuum})$

$z = a/2c$

bcc (110):

orthorhombic CXY-lattice: $a, \sqrt{2}a, c$

(0 0 0)
(0 .5 +/-z)
(0 0 +/-2z)
 $z = a/\sqrt{2}a c$

Work function

Work
function

$$WF = :VZERO - :FER \quad (\text{check convergence with vacuum})$$

Total energies and atomic forces

(Yu et al.; Kohler et al.)

■ Total Energy:

- *Electrostatic energy*
- *Kinetic energy*
- *XC-energy*

$$U[\rho] = \frac{1}{2} \int d^3\vec{r} \rho(\vec{r}) V_{es}(\vec{r}) + \frac{1}{2} \sum_{\alpha} Z_{\alpha} V_{es}^{\alpha}(\vec{r})$$

$$T[\rho] = \sum_i n_i \varepsilon_i - \int d^3\vec{r} \rho(\vec{r}) V_{eff}(\vec{r})$$

$$E_{xc}[\rho] = \int d^3\vec{r} \rho(\vec{r}) \varepsilon_{xc}(\vec{r})$$

■ Force on atom α :

$$\vec{F}^{\alpha} = \frac{-dE_{tot}}{d\vec{R}_{\alpha}} = F_{HF}^{\alpha} + F_{core}^{\alpha} + F_{val}^{\alpha}$$

- *Hellmann-Feynman-force*
- *Pulay corrections*

$$F_{HF}^{\alpha} = Z_{\alpha} \sum_{m=-1}^1 \lim_{r_{\alpha} \rightarrow 0} \frac{V_{1m}^{es}(r_{\alpha})}{r_{\alpha}} \nabla_{\alpha} [r_{\alpha} Y_{1m}(\hat{r})]$$

- *Core*
- *Valence*

$$F_{core}^{\alpha} = - \int \rho_{core}(r) \nabla_{\alpha} V_{eff}(r) d\vec{r}$$

- *expensive, contains a summation of matrix elements over all occupied states*

$$F_{val}^{\alpha} = \int_{\alpha} V_{eff}(r) \nabla_{\alpha} \rho_{val}(r) d\vec{r} + \sum_{k,i} n_i \sum_{K,K'} c_i^{*}(K') c_i(K) \times$$

$$\left[(K^2 - \varepsilon_i) \oint \phi_{K'}^{*}(r) \phi_K(r) dS_{\alpha} - i(K - K') \langle \phi_{K'} | H - \varepsilon_i | \phi_K \rangle_{\alpha} \right]$$

Optimization of internal parameters using “forces”

■ Forces only for “free” structural parameters:

- *NaCl: (0,0,0), (0.5,0.5,0.5) : all positions fixed by symmetry*
- *TiO₂: Ti (0,0,0), O (u,u,0): one free parameter (u,x,y,z)*

■ Forces are only calculated when using “-fc”:

- *run_lapw -fc 1.0 (mRy/bohr)*

- *grep :fgl002 case.scf*

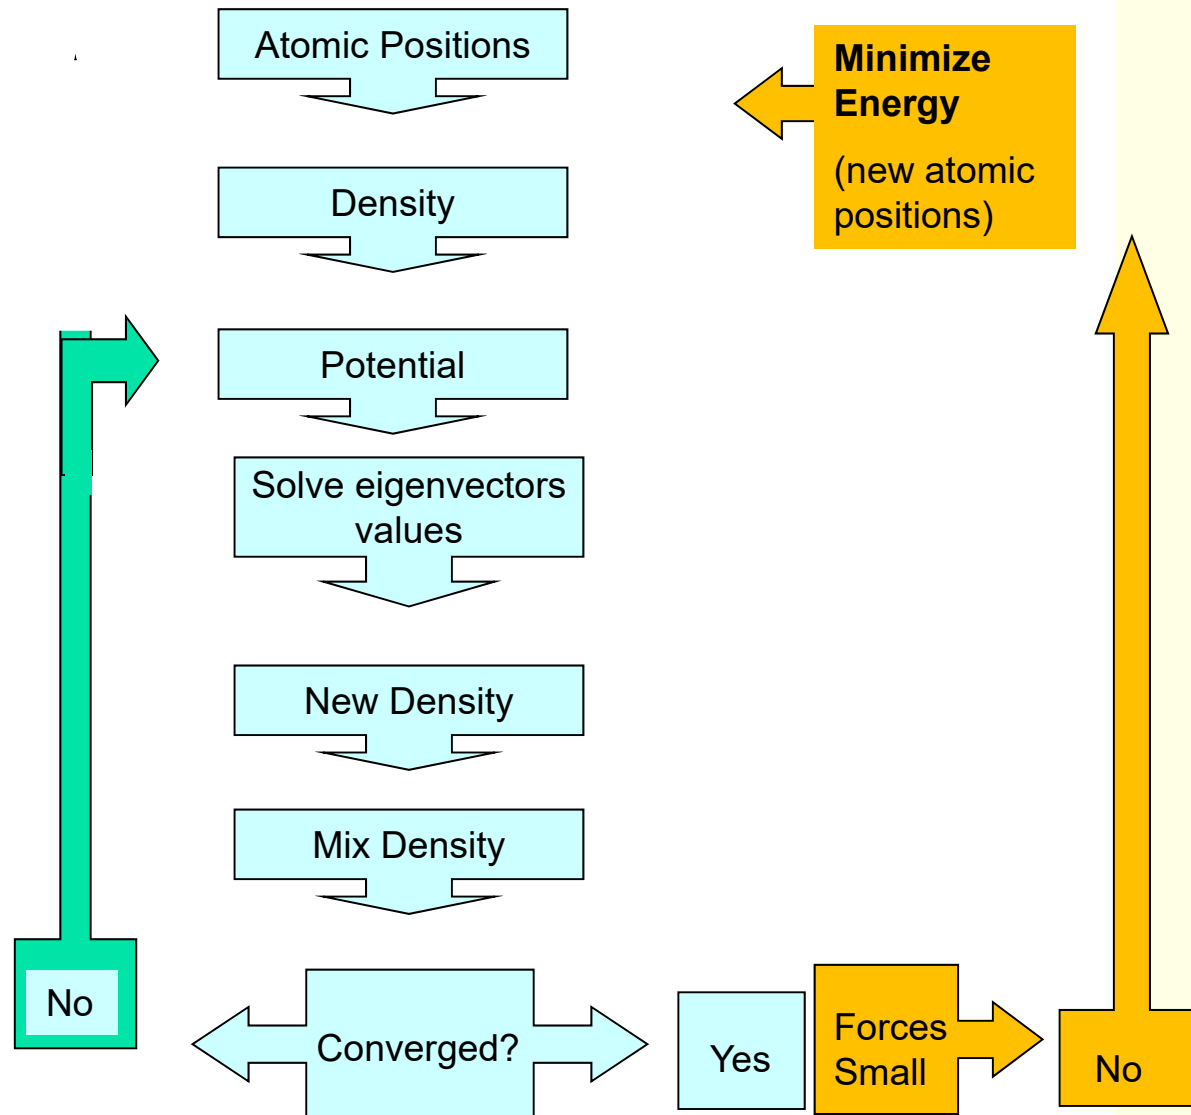

■ 200.	partial	
■ -130.	partial	
■ 140.	partial	
■ 135	partial	only $F_{\text{HF}} + F_{\text{core}}$
■ 120	partial	
■ 122	partial	forces converging
■ 121	partial	→ changes “TOT” to “FOR” in case.in2
■ -12.3	total	$F_{\text{HF}} + F_{\text{core}} + F_{\text{val}}$, only this last number is correct

■ Forces are useful for

- *structural optimization (of internal parameters)*
- *phonons*

Structure optimization (atomic positions)

Traditional way:

- Inner loop: obtain fixed-point for given atom positions
- Outer loop: optimize atomic positions

Current algorithms

- Calculate SCF mapping, time T_0
- Broyden expansion for fixed-point problem, self-consistent density, N_{SCF} iterations
- BFGS is most common for optimizing the atomic positions (Energy), N_{BFGS}
- Time scales as $N_{\text{SCF}} * N_{\text{BFGS}} * T_0$

each step is a **full**
scf calculation
producing
accurate forces

- `/home/pblaha/tio2> min_lapw [-p -it -sp] [-j "run -fc 1 -p -it"] [-NI]`
 - *performs scf-cycle for fixed positions*
 - *get forces and move atoms along forces (building an approximate Hessian) and writing a new case.struct file*
 - *extrapolate density (case.clmsum)*
 - *perform next scf cycle and loop until forces are below „tolf“*
 - **CONTROL FILES:**
 - `.minstop` stop after next structure change
- `tio2.inM` (generated automatically by "pairhess" at first call of min_lapw)
 - `PORT 2.0` `$(NEW1, NOSE, MOLD, tolf (a4,f5.2))`
 - `0.0 1.0 1.0 1.0` `# Atom1 (0 will constrain a coordinate)`
 - `1.0 1.0 1.0 1.0` `# Atom2 (NEW1: 1,2,3:delta_i, 4:eta (1=MOLD, damping))`
- **monitor minimization in file `case.scf_mini`**
 - *contains last iteration of each geometry step*
 - *each step N is saved as case_N.scf (overwritten with next min_lapw !)*
 - `grep :ENE case.scf_mini`
 - `grep :FGLxxx case.scf_mini` `(:POSxxx)`

Optimization of atomic positions (E-minimization via forces)

- damped Newton mechanics scheme (NEW1: with variable step)
- **quite efficient quasi-Newton (PORT) scheme**
 - minimizes E (using forces as gradients and construct approx. Hessian)
 - If minimizations gets stuck or oscillates: (because E and F_i are inconsistent):
 - touch .minstop; min -nohess (or rm case.tmpM .min_hess)
 - improve scf-convergence (-ec), Rkmax, k-mesh, ...
 - change to NEW1 scheme

W impurity in Bi (2x2x2 supercell: Bi_{15}W)

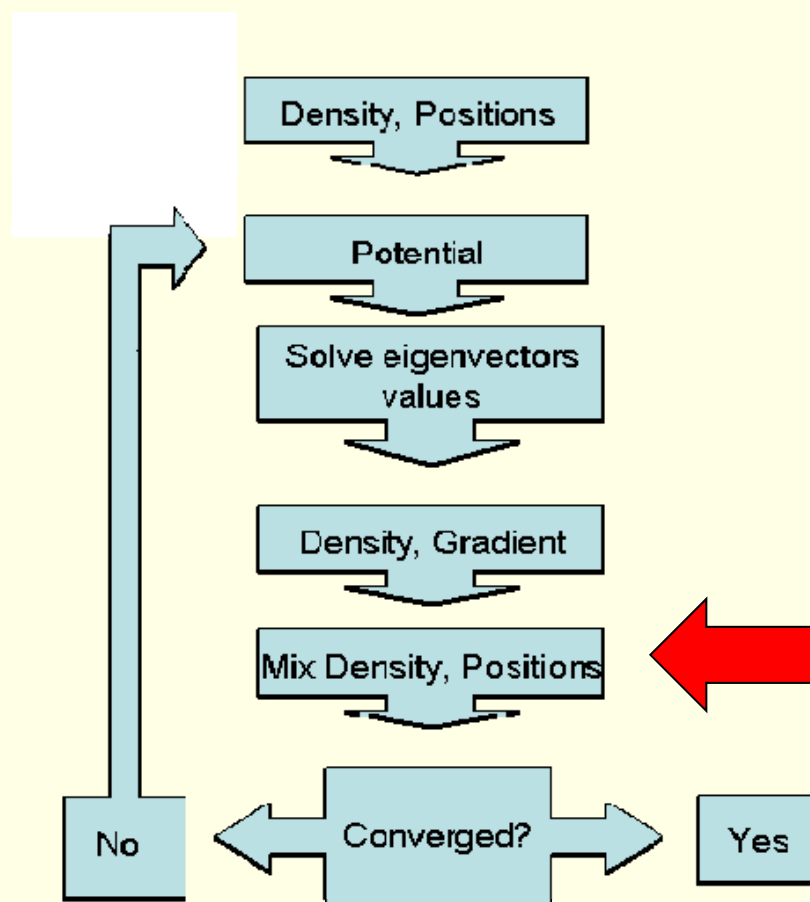

Alternative method: **Fused Loop**

- Treat the **density** and **atomic positions** *all* at the same time.
- No restrictions to “special” cases, general algorithm has to work for insulators, metals, semiconductors, surfaces, defects, hybrids....
- Few to no user adjustable parameters

Fused Loop

Broyden Fixed-Point Methods

- Solve $(\rho(r,x)-F(\rho(r,x)),G)=0$
- $s_k = (\rho, x)_{k+1} - (\rho, x)_k$; $y_k = (F(\rho, x), G)_{k+1} - (F(\rho, x), G)_k$
- Broyden's "Good Method"

$$B_{k+1} = B_k + \frac{(y_k - B_k s_k) s_k^T}{s_k^T s_k} \quad H_{k+1} = H_k + \frac{(s_k - H_k y_k) s_k^T}{s_k^T y_k}$$

- Broyden's "Bad Method"

$$H_{k+1} = H_k + \frac{(s_k - H_k y_k) y_k^T}{y_k^T y_k}$$

C.G. Broyden, A Class of Methods for Solving Nonlinear Simultaneous Equations, Mathematics of Computation, 19 (1965) 577-593.

- Generalizable to multiseant method (better,

Comparison of the 2 methods

Larger Problems:

52 atoms, MgO (111)+H₂O

108 atoms AlFe

J. Ciston, A. Subramanian, L.D. Marks, PRB, 79 (2009) 085421

Lyudmila V. Dobysheva (2011)

- `run_lapw -min -fc 1.0 -cc 0.001 -ec 0.0001 [-it -noHinv -p]`
- modifies `case.inm` and sets „**MSR1a**”
- This runs ONE big scf-calculations optimizing the density and the positions (forces towards zero) simultaneously (may need hundreds of iterations).
- Monitor: `:ENE` and `:FR` (av. and max forces, movements)
- it continues until all `:FR` quantities are below „`tolf`” (`case.inM`) and switches then automatically to MSR1 for a final charge optimization (with fixed positions).
- quite efficient, recommended method, still under development by L.Marks (Northwestern Univ).

Calculations of Phonons: The Direct Method

WIEN2k + Phonon

Copyright by K.Parlinski

<http://wolf.ifj.edu.pl/phonon/>

alternatively use A.Togo`s PHONOPY code
(see www.wien2k.at/unsupported)

THEORY OF DIRECT METHOD

System energy E (at $T = 0$) as a function of atomic positions $\mathbf{R}(\mathbf{n}, \mu)$ is

$$E(\mathbf{R}(\mathbf{n}, \mu), \dots, \mathbf{R}(\mathbf{m}, \nu), \dots) = E_0 + \frac{1}{2} \sum_{\mathbf{n}, \mu, \mathbf{m}, \nu} \Phi(\mathbf{n}, \mu, \mathbf{m}, \nu) \mathbf{U}(\mathbf{n}, \mu) \mathbf{U}(\mathbf{m}, \nu)$$

where the *force constant matrix* are

$$\Phi_{i,j}(\mathbf{n}, \mu, \mathbf{m}, \nu) = \left. \frac{\partial^2 E}{\partial R_i(\mathbf{n}, \mu) \partial R_j(\mathbf{m}, \nu)} \right|_0$$

is defined at $\left. \frac{\partial E}{\partial R_i(\mathbf{n}, \mu)} \right|_0 = 0$.

The *dynamical matrix* is defined as

$$\mathbf{D}(\mathbf{k}; \mu, \nu) = \frac{1}{\sqrt{M_\mu M_\nu}} \sum_{\mathbf{m}} \Phi(0, \mu; \mathbf{m}, \nu) \exp\{-2\pi i \mathbf{k} \cdot [\mathbf{R}(0, \mu) - \mathbf{R}(\mathbf{m}, \nu)]\}$$

\mathbf{m} runs over *all* atoms. Diagonalization of the dynamical matrix

$$\omega^2(\mathbf{k}, j) \mathbf{e}(\mathbf{k}, j) = \mathbf{D}(\mathbf{k}) \mathbf{e}(\mathbf{k}, j)$$

gives phonon frequencies $\omega^2(\mathbf{k}, j)$ and polarization vectors $\mathbf{e}(\mathbf{k}, j)$.

Any *atomic displacement* $\mathbf{U}(\mathbf{m}, \nu)$ generates forces

$$\mathbf{F}(\mathbf{n}, \mu) = -\partial E / \partial \mathbf{R}(\mathbf{n}, \mu)$$

on all other atoms. Hence

$$F_i(\mathbf{n}, \mu) = -\sum_{\mathbf{m}, \nu, j} \Phi_{i,j}(\mathbf{n}, \mu, \mathbf{m}, \nu) U_j(\mathbf{m}, \nu)$$

Master equation of direct method.

$$V = \frac{1}{2} k x^2$$

\mathbf{n}, \mathbf{m} : cells
 μ, ν : atoms

CUMMULANT FORCE CONSTANTS

Displace an atom by $\mathbf{U}(\mathbf{m}, \nu)$

$$F_i(\mathbf{n}, \mu) = - \sum_{\mathbf{L}} \Phi_{i,j}(\mathbf{n}, \mu, \mathbf{m} + \mathbf{L}, \nu) U_j(\mathbf{m}, \nu)$$

$\mathbf{L} = (L_a, L_b, L_c)$ are the indices of supercell lattice constants.
or

$$F_i(\mathbf{n}, \mu) = -\Phi_{i,j}^{(\Sigma)}(\mathbf{n}, \mu, \mathbf{m}, \nu) U_j(\mathbf{m}, \nu)$$

where the **cumulant force constant** is

$$\Phi_{i,j}^{(\Sigma)}(\mathbf{n}, \mu, \mathbf{m}, \nu) = \sum_{\mathbf{L}} \Phi_{i,j}(\mathbf{n}, \mu, \mathbf{m} + \mathbf{L}, \nu)$$

\mathbf{L} runs over all supercell images.

$$\Phi_{i,j}^{(\Sigma)}(\mathbf{n}, \mu, \mathbf{m}, \nu) = \sum_{\mathbf{L}} \Phi_{i,j}(\mathbf{n}, \mu, \mathbf{m} + \mathbf{L}, \nu)$$

Supercell dynamical matrix. Exact wave vectors.

Conventional dynamical matrix:

$$D(\mathbf{k}; \mu, \nu) = \frac{1}{\sqrt{M_\mu M_\nu}} \sum_{\mathbf{m}} \Phi(0, \mu; \mathbf{m}, \nu) \exp\{-2\pi i \mathbf{k} \cdot [\mathbf{R}(0, \mu) - \mathbf{R}(\mathbf{m}, \nu)]\}$$

Supercell dynamical matrix:

$$D^{(SC)}(\mathbf{k}; \mu, \nu) = \frac{1}{\sqrt{M_\mu M_\nu}} \sum_{\mathbf{m} \in SC} \Phi^{(SC)}(0, \mu; \mathbf{m}, \nu) \exp\{-2\pi i \mathbf{k} \cdot [\mathbf{R}(0, \mu) - \mathbf{R}(\mathbf{m}, \nu)]\}$$

These two matrices are equal if

$$D^{(SC)}(\mathbf{k}; \mu, \nu) = D(\mathbf{k}; \mu, \nu)$$

- **interaction range** is confined to **interior** of supercell (supercell is big enough)
- wave vector is **commensurate with the supercell** and fulfils the condition (independent of interaction range):

$$\exp\{-2\pi i \mathbf{k}_s \cdot \mathbf{L}\} = 1$$

At wave vectors \mathbf{k}_s the phonon frequencies are “exact”, provided the **supercell contains the complete list of neighbors**.

Wave vectors \mathbf{k}_s are commensurate with the supercell size.

Thermodynamic functions of phonon vibrations

Internal energy:

$$E = \frac{1}{2} r \int_0^\infty d\omega g(\omega) (\hbar\omega) \coth \left(\frac{\hbar\omega}{2k_B T} \right)$$

Free energy:

$$F = r k_B T \int_0^\infty d\omega g(\omega) \ln \left[2 \sinh \left(\frac{\hbar\omega}{2k_B T} \right) \right]$$

Entropy:

$$S = r k_B \int_0^\infty d\omega g(\omega) \left\{ \left(\frac{\hbar\omega}{2k_B T} \right) \left[\coth \left(\frac{\hbar\omega}{2k_B T} \right) - 1 \right] - \ln \left[1 - \exp \left(-\frac{\hbar\omega}{k_B T} \right) \right] \right\}$$

Heat capacity C_v :

$$C = r k_B \int_0^\infty d\omega g(\omega) \left(\frac{\hbar\omega}{k_B T} \right)^2 \frac{\exp \left(\frac{\hbar\omega}{k_B T} \right)}{\left[\exp \left(\frac{\hbar\omega}{k_B T} \right) - 1 \right]^2}$$

Thermal displacements:

$$B_{ij}(\mu) = \langle U_i(\mu) U_j(\mu) \rangle$$

$$B_{il}(\mu) = \frac{\hbar r}{2M_\mu} \int_0^\infty d\omega g_{il,\mu}(\omega) \frac{1}{\omega} \coth \left(\frac{\hbar\omega}{2k_B T} \right)$$

PHONON-I

■ PHONON

- *by K.Parlinski (Crakow)*
- *Linux or MS-windows*
- *uses a „direct” method to calculate **Force-constants** with the help of an *ab initio* program*
- *with these Force-constants phonons at arbitrary *k*-points can be obtained*

- Define your spacegroup
- Define all atoms

<http://wolf.ifj.edu.pl/phonon/>

Phonons:

- *selects symmetry adapted atomic displacements (4 displacements in cubic perovskites)*

(Displacement pattern for cubic perovskite)

- *select a supercell: (eg. 2x2x2 atom P-type cell)*
- *calculate all forces for these displacements with high accuracy(WIEN2k)*
- *→ force constants between all atoms in the supercell*
- *→ dynamical matrix for arbitrary q-vectors*
- *→ phonon-dispersion ("bandstructure") using PHONON (K.Parlinski)*

PHONON-II

- Define an interaction range (supercell)

- create *displacement* file
- transfer *case.d45* to Unix

- Calculate forces for all required displacements

- *init_phonon_lapw*
 - for each displacement a *case_XX.struct* file is generated in an extra directory
 - runs *nn* and lets you define *RMT* values like:
 - 1.85 1-16

- *init_lapw*: either without symmetry (and then copies this setup to all case_XX) or with symmetry (must run *init_lapw* for all case_XX) (Do NOT use *SGROUP*)
- *run_phonon*: *run_lapw -fc 0.1 -i 40* for each case_XX

PHONON-III

- **analyze_phonon_lapw**
 - reads the *forces* of the scf runs
 - generates „*Hellman-Feynman*“ file *case.dat* and a „*symmetrized HF*-file *case.dsy* (when you have displacements in both directions)
 - check quality of forces:
 - $\sum F_x$ should be small (0)
 - $\text{abs}(F_x)$ should be similar for +/- displacements
- transfer case.dat (dsy) to Windows
- Import HF files to PHONON
- Calculate force constants
- Calculate phonons, analyze phonons eigenmodes, thermodynamic functions

Applications:

- phonon frequencies (compare with IR, raman, neutrons)
- identify dynamically unstable structures, describe phase transitions, find more stable (low T) phases.
- free energies at $T > 0$; quasiharmonic approximation

Pyrochlore structure of $\text{Y}_2\text{Nb}_2\text{O}_7$: strong phonon instabilities \rightarrow phase transition
